

## CIS 110: Introduction to Computer Programming

### Lecture 14

#### Booleans and Program Assertions (§ 5.3-5.5)

10/26/2011

CIS 110 (11fa) - University of Pennsylvania

1

## Outline

- The boolean primitive type
- Program assertions and invariants

10/26/2011

CIS 110 (11fa) - University of Pennsylvania

2

## Booleans

10/26/2011

CIS 110 (11fa) - University of Pennsylvania

3

## All hail the mighty boolean

- Booleans are primitives that have two possible values: `true` or `false`
- ```
boolean bTrue = true;
boolean bFalse = false;
```
- Whenever we needed a guard or test, we really needed a *boolean value*.

```
if /* boolean */ { }
for (int i = 0; /* boolean! */; i++) { }
while /* boolean! */ { }
```

10/26/2011

CIS 110 (11fa) - University of Pennsylvania

4

## Relational operators revisited

- Relational operators compare primitive values and return booleans!
- Booleans are themselves primitive, so we can compare them with `!=` and `==`.

```
boolean b1 = 5 > 0;           // true
boolean b2 = 12.7 == 13.5;    // false
boolean b3 = 'c' != 'd';      // true
boolean b4 = b1 == b2;        // false
```

10/26/2011

CIS 110 (11fa) - University of Pennsylvania

5

## Logical operators revisited

- Logical operators take booleans as arguments and produce a boolean value.
- `&&` (logical AND): true iff both args are true
- `||` (logical OR): true iff at least one arg is true
- `!` (logical NOT): opposite of the argument

```
boolean b1 = (5 > 0) && ('c' == 'd'); // false
boolean b2 = b1 || (5 <= 35);       // true
boolean b3 = !(3 < 0);             // true
// boolean b4 = x == 1 || 2 || 3    // bad code!
```

10/26/2011

CIS 110 (11fa) - University of Pennsylvania

6

## Truth Tables

- Since booleans only have two possible values, we can summarize the results of logical operators using *truth tables*.

|            |              |              |              |              |              |
|------------|--------------|--------------|--------------|--------------|--------------|
| $a \& b$   | <b>true</b>  | <b>false</b> | <b>false</b> | <b>true</b>  | <b>false</b> |
| $a \mid b$ | <b>false</b> | <b>true</b>  | <b>true</b>  | <b>false</b> | <b>true</b>  |
| $\neg a$   | <b>false</b> | <b>true</b>  | <b>true</b>  | <b>false</b> | <b>true</b>  |
|            | <b>true</b>  | <b>false</b> | <b>false</b> | <b>true</b>  | <b>true</b>  |

10/26/2011

CIS 110 (11fa) - University of Pennsylvania

7

## Java operator precedence review

|         |      |        |        |      |
|---------|------|--------|--------|------|
| $!$     | $++$ | $--$   | $+$    | $-$  |
| $*$     | $/$  | $%$    |        |      |
| $+$     | $-$  |        |        |      |
| $<$     | $>$  | $\leq$ | $\geq$ |      |
| $=$     | $!=$ |        |        |      |
| $\&&$   |      |        |        |      |
| $\ $    |      |        |        |      |
| $=$     | $+=$ | $-=$   | $*=$   | $/=$ |
| $%=$    |      |        |        |      |
| $\&=&$  |      |        |        |      |
| $\ =\ $ |      |        |        |      |

V (In order of decreasing precedence)

- e.g., these two are different:

- $b1 \&& b2 \mid\mid b3 \&& b4$
- $b1 \&& (b2 \mid\mid b3) \&& b4$

10/26/2011

CIS 110 (11fa) - University of Pennsylvania

8

## Short-circuiting $\&\&$ and $\mid\mid$

- $\&\&$  and  $\mid\mid$  will not evaluate their second argument if it is unnecessary to do so
  - i.e., if the first argument is false ( $\&\&$ ) or true ( $\mid\mid$ ).
  - Necessary behavior to write some guards cleanly!

```
Scanner in = new Scanner(System.in);
String line = in.nextLine();
int pos = 0;
while (pos < line.length() && line.charAt(pos) != 'x') {
    pos++;
}
String tox = line.substring(0, pos);
System.out.println(tox);
```

Without short-circuiting would cause an exception when  $pos == line.length()$ !

10/26/2011

CIS 110 (11fa) - University of Pennsylvania

9

## DeMorgan's Laws

- Identities concerning logical ops and negation.

$$\begin{aligned} !(b1 \mid\mid b2) \\ = \neg b1 \&\& \neg b2 \end{aligned}$$

$$\begin{aligned} !(b1 \&\& b2) \\ = \neg b1 \mid\mid \neg b2 \end{aligned}$$

- Useful for simplifying and reasoning about boolean expressions.

```
while (!s.equals("yes") || s.equals("no")) { ... }
= while (!s.equals("yes") && !s.equals("no")) { ... }
```

10/26/2011

CIS 110 (11fa) - University of Pennsylvania

10

## Boolean flags

- One use of boolean variables is a boolean *flag*.

```
Scanner in = new Scanner(System.in);
boolean seenPie = false;
for (int i = 1; i < 5; i++) {
    System.out.print("Enter word " + i + ": ");
    String line = in.nextLine();
    if (line.equalsIgnoreCase("pie")) {
        seenPie = true;
    }
}
if (seenPie == true) {
    System.out.println("Haha. You said pie.");
} else {
    System.out.println("Good words!");
}
```

This will be true if we ever see "Pie".

10/26/2011

CIS 110 (11fa) - University of Pennsylvania

11

## Boolean Zen

- Boolean zen* is realizing the simplicity of the boolean expressions.

```
if (seenPie == true) {
    // ...
}
```

```
if (seenPie) {
    // ...
}
```

Much simpler!

If  $seenPie$  and  $seenPie == true$  have the same values, why don't I replace...?

|                                |
|--------------------------------|
| $seenPie \mid seenPie == true$ |
| <b>false</b>                   |
| $true \mid true$               |
| <b>false</b>                   |
| $false \mid false$             |
| <b>true</b>                    |

10/26/2011

CIS 110 (11fa) - University of Pennsylvania

12

## Program Assertions

10/26/2011

CIS 110 (11fa) - University of Pennsylvania

13

## Imperative programming

- *Imperative programming*: being able to *mutate* (change) state/variables.
- Mutation makes program reasoning hard!
  - Need to keep track of both *control flow* and *state*.

```
int x = 0;
int y = 5;
int z = 25;
while (x + y < z) {
    System.out.printf("x = %d, y = %d, z = %d\n", x, y, z);
    x += y / 2;
    y += (int)(x * 1.5);
    z += x * 2;
}
System.out.printf("Final: x = %d, y = %d, z = %d\n", x, y, z);
```

10/26/2011

CIS 110 (11fa) - University of Pennsylvania

14

## Assertions

- An assertion is a claim that is *true*, *false*, or *sometimes true and sometimes false*.
  - e.g., "2 + 2 = 4", "Cats bark", "The sky is blue"
- *Programming assertions* are such claims made about the state of a program.

```
while (i > 0) {
    // ...
}
// Is i > 0 always/never/sometimes true here?
```

10/26/2011

CIS 110 (11fa) - University of Pennsylvania

15

## Assertions implicitly made by programming constructs

- By design, certain language constructs enforce some assertions, e.g., if-statements.

```
if (test) {
    // point A
}
// point B
```

At point A, test is  
*always* true.

At point B, test is  
*sometimes* true.

10/26/2011

CIS 110 (11fa) - University of Pennsylvania

16

## Assertions and if-else

```
if (test) {
    // point A
} else {
    // point B
}
// point C
```

test is *always* true.

test is *always* false.

test is *sometimes* true.

10/26/2011

CIS 110 (11fa) - University of Pennsylvania

17

## More assertions and if-else

```
if (test1) {
    // point A
} else if (test2) {
    // point B
} else {
    // point C
}
// point D
```

test1 is *always* true;  
test2 is *sometimes* true.

test1 is *always* false;  
test2 is *always* true.

test1 is *always* false;  
test2 is *always* false.

test1 is *sometimes* true;  
test2 is *sometimes* true.

10/26/2011

CIS 110 (11fa) - University of Pennsylvania

18

## Assertions and while loops

```
while(test) {
    // point A
}
// point B
```

test is *always* true  
test is *always* false

10/26/2011

CIS 110 (11fa) - University of Pennsylvania

19

## Assertions and for loops

```
for (int i = 0; test; i++) {
    // Point A
}
// Point B
```

test is *always* true  
test is *always* false

10/26/2011

CIS 110 (11fa) - University of Pennsylvania

20

## Exercise that mental model

- In general, we must rely on our mental model of computation to reason about assertions.

```
public static String repeat(String msg, int n) {
    String ret = "";
    // Is ret.length() == 0 always/sometimes/never true?
    for (int i = 0; i < n; i++) {
        ret += msg;
    }
    // Is ret.length() == msg.length() * n
    // always/sometimes/never true?
    return ret;
}
```

Always true!  
Always true!

10/26/2011

CIS 110 (11fa) - University of Pennsylvania

21

## An extended example: mystery

```
public static int mystery(int n) {
    int x = 0;
    // Point A
    if (n < 0) { return -1; }
    while (n != 0) {
        // Point B
        int d = n % 10;
        if (d % 2 == 1) {
            x += d;
        }
        // Point C
        n /= 10;
    }
    // Point D
    return x;
}
```

For each point, are the following always/sometimes/never true?  
 1) n < 0  
 2) x >= 0  
 3) d < 10  
 4) x < n  
 (See AssertionProblem.java.)
