# CIS 1600 Recitation 2 Counting, Sets, Proof Techniques

September 5 & 6, 2023

▲□▶ ▲□▶ ▲ 三▶ ▲ 三▶ 三三 - のへぐ

### Sets

- ▶ A set is an unordered collection of distinct objects. {a, b, c}
- Two sets are equal if and only if they have the same elements.
- The *cardinality* |S| is the number of elements in *S*.
- A is a subset of B (A ⊆ B) if and only if every element of A is an element of B.
- A *powerset* of  $S(\mathcal{P}(S))$  is a set of all possible subsets of S.
- $\blacktriangleright \mathbb{N} = \{0, 1, 2, 3, ...\}, \mathbb{Z} = \{..., -2, -1, 0, 1, 2, ...\},\$

 $\mathbb{Q} = \{ p/q | \ p \in \mathbb{Z} \land q \in \mathbb{Z} \land q \neq 0 \}, \mathbb{R} \text{ is a set of real numbers.}$ 

## Set Operations

- Union: x is in  $A \cup B$  if x is in A, B, or both
- Intersection: x is in  $A \cap B$  if x is in both A and B
- Disjoint: A, B are disjoint if  $A \cap B$  is the empty set.
- Partition: {A<sub>1</sub>, A<sub>2</sub>, ..., A<sub>n</sub>} is a partition of A if and only if (i) A = ∪<sub>i=1</sub><sup>n</sup> A<sub>i</sub> and (ii) A<sub>1</sub>, A<sub>2</sub>, ..., A<sub>n</sub> are mutually (pairwise) disjoint.
- Difference: A \ B or A − B contains elements that are in A not but in B.
- Complement:  $\overline{A}$  contains all elements not in A.  $\overline{A} = U \setminus A$  when U is the universe of elements.
- Cartesian Product:  $A \times B = \{(a, b) \mid a \in A, b \in B\}$

# DeMorgan's Laws

 $\blacktriangleright$  Let A, B, C be sets.

$$A \setminus (B \cup C) = (A \setminus B) \cap (A \setminus C)$$
$$A \setminus (B \cap C) = (A \setminus B) \cup (A \setminus C)$$

#### Permutations

Let A be a non-empty set with n elements, that is, |A| = n.

- A permutation of A is an ordering of the elements of A in a row without repetition.
- The number of permutations is  $n! = n \cdot (n-1) \cdot ... \cdot 2 \cdot 1$ .
- A partial permutation of r out of the n elements of A consists of picking r of the elements of the set and ordering them in a row without repetition.

(日)((1))

• The number of partial permutations is  $\frac{n!}{(n-r)!}$ .

#### Combinations

Let A be a non-empty set with n elements, that is, |A| = n.

A combination of r elements from the n elements of A is an unordered selection of r of the n elements of A, where r is a natural number.

▲□▶▲□▶▲≡▶▲≡▶ ≡ めぬぐ

• The number of combinations is 
$$\binom{n}{r} = \frac{n!}{(n-r)!r!}$$

$$(_r^n) = \begin{cases} 0, \text{ if } r > n \\ 1, \text{ if } r = 0 \text{ or } r = n \\ n, \text{ if } r = 1 \end{cases}$$

### Proof by Contradiction

- ► To prove that a claim p is true, assume that ¬p is true. Then, we have to show that ¬p is false by reaching a contradiction (some statement that is always false).
- For example, if we want to prove that p ⇒ q, we could show that p ∧ ¬q leads to a false statement.
- Example: Prove that "if 3n + 2 is odd then n is odd." We can show this by contradiction by assuming that "3n + 2 is odd and n is even" and showing that this statement is false. (Proof done in Lecture 2H)

## Proof by Contrapositive

- To prove that  $p \implies q$  is true, we can show that  $\neg q \implies \neg p$  is true.
- Example: Prove that "if x and y are integers where x + y is even, then x and y are both odd or both even". We can show this by proving the contrapositive, "if exactly one of x or y is even then x + y is odd". (Proof done in Lecture 2H)
- Similar to proof by contradiction but in proof by contradiction you assume both p and ¬q are true where as in proof by contrapositive you just assume ¬q is true.
